

Problem Statement No. 15: The Daily Air Quality Action Agent

The Challenge

Air pollution is a major public health crisis, contributing to respiratory issues, climate change, and reduced quality of life. Citizens often receive Air Quality Index (AQI) data in technical formats that are difficult to understand and translate into daily actions.

The Objective

Build an AI-powered Daily Air Quality Action Agent that:

- Retrieves and interprets real-time AQI data using RAG.
- Provides personalized health recommendations.
- Forecasts poor air-quality events and generates alerts.
- Delivers policy and awareness insights.
- Supports a multi-agent architecture.
- Presents information through an interactive dashboard.

Tech Stack

- LangFlow
- IBM watsonx.ai
- IBM Granite Models

Multi-Agent System

1. AQI Data Agent
2. Health Advisory Agent
3. Forecasting Agent
4. Community Action Agent
